

AUGUST 2021

MONTHLY EDITION

MD Anderson Cancer Center

Making Cancer History®

In this month's Leukemia Insights newsletter, written by <u>Elias Jabbour</u>, <u>M.D.</u>, and <u>Nitin Jain</u>, <u>M.D.</u>, and sponsored in part by the Charif Souki Cancer Research Fund, we describe clinical trials available at our institution for patients with ALL, including Philadelphia chromosome (Ph)-negative and positive disease, and in both the frontline and salvage settings. Learn more about our <u>Leukemia program</u>.

Novel approaches for the treatment of ALL in adults in 2021

Acute lymphoblastic leukemia (ALL) is characterized by clonal proliferation of lymphoid progenitors. In the last decade, significant advances have been made understanding the disease pathogenesis, prognostic groups and developing novel therapies that target specific subsets. Therapies targeting either specific transcripts (e.g. Bcr-Abl tyrosine kinase inhibitors) or specific leukemic cell surface antigens (e.g. CD20, CD22, and CD19 monoclonal antibodies) are major breakthroughs. These novel therapies and combinations are transforming treatment strategies for adults with ALL and are beginning to result in significant improvements in survival. In this newsletter, we describe clinical trials available at our institution for patients with ALL, including Philadelphia chromosome (Ph)-negative and positive disease, and in both the frontline and salvage settings. Many of these approaches focus on decreasing or eliminating the role of chemotherapy, with the goal of making these regimens more tolerable in older adults and also decreasing the morbidity and mortality associated with myelosuppression-related infections other complications of intensive chemotherapy.

When referring a patient for these trials, remember that most allow up to 2 previous cycles of therapy; therefore patients are eligible 1-2 months after diagnosis. Furthermore, the monoclonal and bispecific antibody constructs (e.g. inotuzumab ozogamicin or blinatumomab) are provided free of charge as part of the trial.

1. Frontline Ph-negative ALL

 Hyper-CVAD + blinatumomab: Hyper-CVAD is the standard of care for adults able to tolerate intensive

ABOUT MyMDAnderson

myMDAnderson is a secure, personalized web site helping community physicians expedite patient referrals, as well as improve continuity of care through information access and streamlined communications.

Physicians who have referred patients to MD Anderson or plan to do so, can utilize the HIPAA compliant features of myMDAnderson to:

- · Refer a patient
- View your patient's appointments Access patient reports
- Send and receive secure messages

JOIN THE COVERSATION Connect with us.

JOIN OUR MAILING LIST

If you would like to receive an electronic issue of the MD Anderson Leukemia Insights e-Newsletter on a monthly basis, please email us at Leukemia@mdanderson.org.

It's the easiest way to stay current with information on the latest leukemia news, research, and resources. <u>View archived issues.</u>

CONTACT OUR STAFF

Mary Alma Welch - Editor Lisa Palacios - Publishing Editor Leukemia@mdanderson.org chemotherapy. Blinatumomab, the CD3-CD19 bispecific T-cell engager, has also shown significant promise in the treatment of ALL, with recent FDA approval based on a survival advantage for patients with relapsed or refractory ALL compared with combination chemotherapy. Blinatumomab has also shown efficacy in eliminating minimal residual disease (MRD). In this study, only 4 (rather than 8) courses of chemotherapy are given, followed by 4 cycles of blinatumomab incorporated into an 18-month maintenance regimen (half the duration of standard POMP maintenance). With the addition of blinatumomab, the goal is to both decrease the amount of intensive chemotherapy received and deepen responses. In the first 38 adult patients treated with Hyper-CVAD plus blinatumomab, the CR rate was 100%, the MRD negativity rate was 97%, and the estimated 3-vear survival was 83% (compared to 60% with the historical HCVAD-ofatumumab). This protocol was amended to add the CD22 antibody-drug conjugate inotuzumab ozogamicin, thereby incorporating all of the most active agents in B-cell ALL into our frontline regimen. Ten patients were so far enrolled and treated with very encouraging results.

- If the data mature with similar results in a larger cohort of patients, this may open a new form of therapy in adult ALL. (Figure 1)
- Hyper-CVD + inotuzumab ozogamicin + blinatumomab: Because many older patients with ALL are not able to tolerate intensive chemotherapy, we have designed low-intensity chemotherapy regimen (hyper-CVD) combined with the two most active monoclonal antibodies in ALL: inotuzumab ozogamicin and blinatumomab. Inotuzumab is given at lower, fractionated doses in an attempt to decrease the rate of veno-occlusive disease while maintaining efficacy. Blinatumomab was added to deepen the level of response. In the most recent update of 70 treated patients, the overall response rate is 98%, and no early deaths were observed. Overall, 95% of

- patients achieved MRD negativity. The 5-year overall survival rate is 54%, which compares favorably to historical data in which similar populations had a cure rate of only 20% (Figure 2). These data are the best reported thus far in this population. This regimen is also available for patients with relapsed/refractory Ph-negative ALL of any age.
- Other regimens include hyper-CVAD plus nelarabine and the Bcl-2 inhibitor venetoclax (for T-cell ALL) and lowintensity chemotherapy plus venetoclax and navitoclax (for older patients with Phnegative ALL). Pre-clinical studies have demonstrated activity of venetoclax and navitoclax in B-cell and T-cell ALL cell lines. Preclinical data suggests as well significant synergy with chemotherapy. **Preliminary** results of the combination of venetoclax with low-intensity chemotherapy in newly diagnosed older patients unfit for intensive chemotherapy are promising with objective response and MRD negativity rates of 91% and 100%, respectively. The study provides venetoclax and navitoclax free of charge and is open for accrual. This regimen is open as well for patients with relapsedrefractory ALL, including mainly T-cell ALL.

2. Frontline Ph-positive ALL

 Hyper-CVD + ponatinib + blinatumomab: Ponatinib is a potent third generation Bcr-Abl tyrosine kinase inhibitor (TKI) that also suppresses the T315I mutation, which confers resistance to all other commercially available TKIs. A study of hyper-CVAD plus ponatinib resulted in a 5-year overall survival rate of 74%, the best so far described in Ph-positive ALL (long-term survival is 40-50% with earlier-generation TKIs). When compared to hyper-CVAD plus dasatinib in a propensity score matching analysis, the combination of H-CVAD and ponatinib had a significantly higher CMR rate (82% versus 65%) and higher 3-year survival rate (83% versus 60%).

- experience that full-intensity hyper-CVAD results in significant toxicity in many patients, there is a rationale to combine ponatinib with less intensive а chemotherapy backbone. Given its activity in Ph-positive ALL, blinatumomab is also added to this regimen. The goal is that by toxicity from reducing intensive chemotherapy and incorporating the most agents in Ph-positive ALL active (blinatumomab and ponatinib), we will reduce treatment-related morbidity mortality and further increase the cure rate. This regimen is open to patients of all ages with newly diagnosed Ph-positive ALL, in particular, patients with Ph-positive ALL transformed from chronic myeloid leukemia. The CMR rate was 85% and the estimated 1-year survival rate was 88% among 11 treated. **Ponatinib** patients blinatumomab are provided free of charge.
- Blinatumomab and ponatinib: Blinatumomab was evaluated in the Phase ALCANTARA trial in patients with relapsed/refractory Ph-positive ALL. In this study, 36% of patients achieved complete remission (CR) or CR with incomplete hematologic response and was active in patients with T315I mutations. The median overall survival was 7.1 months. We have treated 8 patients with relapsed/refractory Ph-positive leukemias with the combination of ponatinib and blinatumomab, 6 of whom (75%) achieved CMR. With a median follow-up of 10 months, the 1-year overall survival rate was 75%. We are therefore evaluating this combination blinatumomab and ponatinib, а chemotherapy-free combination in patients with newly diagnosed and relapsed-refractory Phpositive ALL. So far 44 patients (24 with newly diagnosed disease) were enrolled and treated. In the frontline treatment, 85% have achieved a complete molecular response within 3 months (58% at 4 weeks). The estimated 2-year survival rate is 95%. (Figure 3)

3. Minimal Residual Disease

Persistence or reappearance of minimal residual disease (MRD) after induction chemotherapy is the most important adverse prognostic factor in patients with ALL and identifies chemo-refractory disease. More than 90% of patients who have persistent MRD after chemotherapy experience a clinical relapse, despite continued chemotherapy, with a median time to relapse of 4-5 months.

- Blinatumomab: Blinatumomab assessed in 116 patients with ALL in CR but with MRD positivity. Approximately 78% achieved MRD negativity after one cycle. With a median follow-up of 29 months, the median survival was 36 months. The median OS for those who achieved MRDnegative status was 40 months versus 12 months for those who remained MRDpositive. A Phase II study of blinatumomab in patients with B-cell ALL in first or second/third CR with positive MRD (≥0.01%) is active at our institution. Patients with Philadelphia-positive disease are eligible and will receive blinatumomab in combination with TKI. Thirty-nine patients have been treated so far. The MRD negativity rate is 74%, with 3-year survival rate of 65%.
- Inotuzumab ozogamicin: Inotuzumab has shown significant activity in R/R ALL with higher efficacy observed in patients with minimal disease and in those treated in Salvage 1 compared to Salvage 2 and beyond. Inotuzumab is currently being assessed in patients with both Ph-negative and Ph-positive ALL with positive MRD. Patients with Ph-positive disease can also receive a TKI. So far, 16 patients were treated, 50% achieved MRD negativity. The estimated 1-year survival was 75%.

Both blinatumomab and inotuzumab are provided free of charge.

4.Salvage treatments

Ph-negative ALL

- Hyper-CVD + inotuzumab ozogamicin blinatumomab: This regimen combines low-intensity chemotherapy with the two most active monoclonal antibodies in ALL (inotuzumab ozogamicin and blinatumomab). To date, 96 patients have been treated. The overall response rate is 80%, with particularly efficacy in patients in first salvage (response rate: 91%). The 2year overall survival rates for the entire cohort and for patients in first salvage are 39% and 51%, respectively. A historical comparison with patients who received inotuzumab ozogamicin as a single agent shows a significant benefit to the combination regimen (median overall survival: 14 months versus 6 months). strongly suggesting combination therapies should be offered to patients with Ph-negative ALL with relapsed/refractory disease.
- **Hyper-CVD + venetoclax + navitoclax:** Venetoclax is an oral Bcl-2 inhibitor that has activity across a wide variety of hematologic malignancies. Preclinical data suggests significant synergy with chemotherapy and particular efficacy in patients with T-cell ALL. We have therefore designed a Phase I/II study of the combination of hyper-CVD plus patients venetoclax for relapsed/refractory ALL. This regimen is particularly promising for patients with Tcell ALL, which is an unmet need as there are currently no approved monoclonal antibodies this ALL subtype. Early results are encouraging with an objective response rate of 74% obtained in patients with refractory disease. The study was amended and current patients are receiving the combination of low dose chemotherapy and venetoclax and navitoclax.
- ADCT-602: ADCT-602 is an antibody

- drug conjugate composed of humanized monoclonal antibody directed against CD22, conjugated to SG3199, a pyrrolobenzodiazepine (PBD) cytotoxin. ADCT-602 is being assessed at our institution in a Phase I/II trial. The hope is that this agent will be a potent anti-CD22 therapy, without the hepatic toxicity associated with inotuzumab ozogamicin. This trial is currently open in the Phase I part. Patients with R/R B-ALL are eligible. Prior allogeneic stem cell transplant is allowed. This drug is given IV weekly. The drug is provided free of charge.
- CAR T-cells: CAR T-cells directed at CD19 have emerged as an effective approach for patients with aggressive Bcell lymphomas and pediatric ALL. With this therapeutic approach, autologous Tcells are engineered to express a directed CD19, receptor at mediates cytotoxicity. These cells have been noted to expand and persist in vivo. which may lead to more durable responses. The most notable toxicities encountered with CAR T-cell therapies include cvtokine release syndrome neurological (CRS), toxicity (called ICANS) and B-cell aplasia. The FDA tisagenlecleucel approved for the treatment of relapsed/refractory ALL in patients up to age 26. In clinical trials, the response rate is 59% (83% among patients who were evaluable efficacy). The 12-month duration of response is 64%.
- We have trials of both CD19 and CD22-directed CAR T-cells, as well as allogeneic CAR T-cells. Allogeneic CAR T-cells offer an "off-the-shelf" approach, in which the cells are derived from sources other than the patient such as from healthy-volunteer donors, or iPSC (induced pluripotent stem cell) line. Hence there is no requirement to leukopherese patients and then wait for the cells to be manufactured.

Below are the current CAR T-cell studies at MD Anderson:

Target	Product	Autologous vs. Allogeneic
CD19	Fate Therapeutics	Allo (derived from IPSC line)
	Autolus	Auto (low-affinity CD19)
	TCR2	Auto
	Precision Bio	Allo (derived from healthy donors)
CD22	UCART22	Allo (derived from healthy donors)

Ph-positive ALL

- Blinatumomab and ponatinib: addition to being tested in older adults with newly diagnosed Ph-positive ALL the chemotherapy-free above), blinatumomab combination of ponatinib is being evaluated in patients with relapsed/refractory Ph-positive ALL. This regimen combines two of the most active agents in Ph-positive ALL, both of which are capable of overcoming the T315I resistance mutation, which is the dominant mechanism of relapse in Phpositive leukemias.
- Venetoclax and ponatinib: The Bcl-2 venetoclax inhibitor has shown multiple significant promise across leukemias, with FDA approval patients with relapsed/refractory CLL with 17p deletion and with excellent safety and efficacy when combined with lowintensity therapies in older patients with AML. There is significant preclinical combination rationale for the οf venetoclax and ponatinib, with combination showing synergistic activity in preclinical models. Ponatinib may also help to prevent venetoclax resistance by preventing upregulation of Mcl-1, an established resistance mechanism of venetoclax-based regimens. A Phase I/II trial of the oral, chemotherapy-free regimen is now accruing for patients of all ages with relapsed/refractory Ph-

- positive ALL. We have completed Phase I of this entirely oral and chemotherapy-free combination of ponatinib, venetoclax and dexamethasone in patients with relapsed/refractory Ph-positive ALL. At the recommended Phase II dose of venetoclax, the CR/CRi rate was 83% with no relapses to date. This trial is now in Phase II expansion and is accruing for patients of all ages with relapsed/refractory Ph-positive ALL.
- Inotuzumab and bosutinib: randomized trial comparing inotuzumab with physician's choice of chemotherapy in patients with relapsed/refractory ALL in first or second salvage showed a significant improvement in response rates and survival with inotuzumab. Bosutinib is a second-generation TKI and dual Abl and Src kinase inhibitor that is active in Ph-positive leukemias. A Phase I-II trial assessing the combination of inotuzumab and bosutinib in patients with newly diagnosed and relapsed/refractory ALL is enrolling. Eighteen patients with relapsed/refractory disease have been treated. The CR/CRi rate is 83%, and CMR rate 56%. The median overall survival is 13.5 months

The <u>Leukemia Department</u> welcomes and will facilitate referrals, and would like to work with you to make novel therapies available to your patients. For referrals, please contact any of the <u>Leukemia faculty</u> listed

Announcements

9th Annual Society of Hematologic Oncology (SOHO) Meeting

The ninth annual meeting of the Society of Hematologic Oncology will be held as a virtual event on September 8-11, 2021. Note that SOHO members receive a significant discount on registration fees. SOHO membership is FREE for a limited time. Sign up now to receive a SOHO member discount code to apply towards your annual meeting registration fee. Click the following link to begin the secure registration process: https://www.soho2021.com/soho2021/registration

Cure of Leukemias in the Next Decade - A Realistic View

You are cordially invited to join our MD Anderson Cancer Center's Physician Advisory Council CME lecture session presented by Hagop M. Kantarjian, M.D. on September 9, 2021. This live activity has been approved for AMA PRA Category 1 Credits™. View the event flyer or register now.

Bridging Oncology and Primary Care Education Series

MD Anderson Cancer Center is featuring an online educational series for all health care provider specialties. This series will feature specialized presentations covering: Gastroenterology, Internal Medicine, Dermatology/Melanoma, Hematology, Breast, Gynecologic Oncology, Immunology, Thoracic and Head & Neck, COVID Related Topics and Hot Topics. The modules are pre-recorded and will be available through July 15, 2021–February 1, 2022. To view more details or register, go to http://mdanderson.org/ccc21.

Leukemia Faculty Contacts

Completing these studies in a timely manner will allow us to move quickly on positive leads. We appreciate referrals and will make every effort, once a patient is enrolled on a study, to continue as much of the care as possible through the referring oncologist. We also will keep you apprised of the patient's progress. <u>View our faculty roster</u>.
